

# CowPots™

The pots you plant!

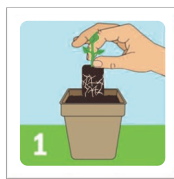

## Directions for Seed Starting & Transplanting Seedlings

### Sow or Transplant

Fill CowPots with potting soil mix and plant seeds (according to directions on seed packet) or transplant seedling.

- ◆ Make sure to use the appropriate size CowPot when planting.

### Nurture

Water and fertilize as needed.

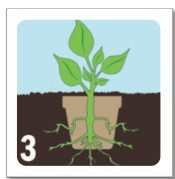

- ◆ Manure naturally retains moisture—make sure not to over water.
- ◆ Give the pot time to harden between watering. (prevents over-watering and deters spores in the air from attaching themselves to the porous CowPots)
- ◆ If possible leave space between pots for maximum air circulation. (improves pot performance, and plant health)
- ◆ Allow pot to dry before handling. (CowPots are fragile when wet)

### Plant

When seedlings are ready for planting, simply place CowPots into soil, and water.

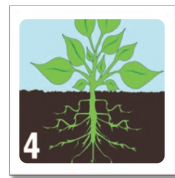

- ◆ Do not break up the CowPot. (Roots are waiting for contact with soil to continue to grow, breaking the pot will damage the roots creating transplant shock)
- ◆ Plant entire CowPot and cover completely with soil.

### Enjoy

Cowpots last for months above ground but once transplanted into garden soil, the pots begin to degrade and enhance your garden soil.

- ◆ Roots penetrate the CowPot wall, eliminating transplant shock.
- ◆ Unrestricted root growth ensures a healthier stronger plant.
